Project name: Automotive Music Player

Project description:

For this assignment we are going with an automotive theme. The music icons will be draggable to the center screen in the car and it will play the music.

The background SVG is based on a Tesla interior. I went with that one because it has a large center screen, and the interior is simple and very recognizable from a certain key features.

Dev Notes:

Abram Kouwen:

I have set up the base html page and added some css to line things up roughly to where I want it. There is still a lot of work to do on it to get to where I need it. For the js and drag and drop I am still learning about the various techniques, so I haven't tried to implement them yet. The SVGs were made already before by me for the SVG Icon store so I have decided to use them here in this project. Aman is working on the audio files.
